

To take a phone & work remotely from your company's office, this sheet will help you determine if your home or remote setup is prepared for TeleVoIPs service.

## What type of phone do you have?

Depending on the phone model being used, your individual set up may vary. Are you using a Wi-Fi enabled VoIP phone? See images below of TeleVoIPs recommended phones.

**\*\*Please note you may be using a different model phone at your company\*\***

### Wi-Fi Example

Yealink T54W

### Hard-Wired Example

Yealink T54W

Yealink T27G

## Remote Requirement Checklist

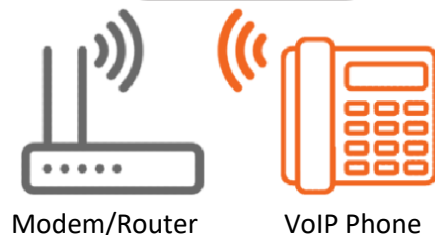

The following are the minimum requirements to check before using a remote phone:

- **Highspeed Internet Connection** (no DSL or satellite)
- **Power adapter for the phone**
- **Wireless router for a Wi-Fi phone**
- **Available ethernet port on the router/modem to plug into for a hardwired phone**
- **Ethernet cord reaches from the phone to the router for a hardwired phone** (are they in the same room?)

## Example Diagrams

The below diagrams are examples of how your home/remote internet connection COULD be set up, individual set ups may vary. Some internet providers have separate cable modem and routers while others use a hybrid of the two. Some setups may also use a switch for additional ethernet port needs.
